> so.*

But GetCommandLine **will** always return the command line.

Or at least: this is the only function to get something like a command-line.

You can use "GtModuleFileName(NULL, ...)" to get the real EXE-Name and then you can check with the first parameter if this is the EXE-Name (of course this is not trivial, because it might be with(out) path and/or short-filename).

The first parameter is always until the first space occurs, or if it is quoted, until the next quote (") occurs.
