That has a higher chance of success than CSRSS, but... what are you trying to accomplish here?

Sounds like you are going about whatever it is in entirely the wrong way. Doing things like you are describing is also likely to get you flagged as malware, I would suspect.

Only if you can abide by the restrictions of not needing to call anything that talks to CSRSS or win32k (i.e. a pure native process). What are you trying to accomplish? There may be a better way.

well, I just need to execute some file. If this is really impossible, surely, I can solve the problem by f.e. signalling to some other process that there is the need to execute that file..

I just needed the confirmation, that this is a known behaviour.. Don't you know, whether winlogon would allow me to execute a process, if call CreateProcess from within Winlogon?
