hi, Volodymyr,  
as you mentioned,

You may always pass the name of dll from process "A" to process "B", so that "B" will load it legally using LoadLibrary and call the exports.

I want to call those exports in process A, so I can not use GetProcAddress() to get handles of exports.

you ask about the goal...let me put it this way.  
there is a running process B, process A called CreateRemoteThread() to inject a DLL named c.dll to B;  
c.dll has exports including fun1(), fun2(), fun3()...

remember c.dll is loaded in process B. I want to call those exports in A, maybe frequently, but execute in B's context and change something in B.

so...is that possible?

Thank you again, Volodymyr, you also solved my problem in another forum topic:)

Let's start from the goal. What are you trying to achieve? You may always pass the name of dll from process "A" to process "B", so that "B" will load it legally using LoadLibrary and call the exports.

can I call a function exported by a DLL in a remote process?  
I mean...there is a DLL loaded in a thread in process A,i want to call a  
export function in that DLL in process B ,is that possible?

the DLL is a win32 compoment.I can change it to COM or whatever you  
suggest.Is there anyway I can do that?  
Thank you very much.

regards,  
Ryan
