Hi Stefan,

thanks for your suggestion. I read this and it really helped me to get what i want, but the still standing question is the one, why i cant query processes running in the context of the Network-Service. I always get GLE=5, Access Denied. I have really any Privilige Enabled for my Process using Admin Principal/Context and opening the Process with Query and the Token also with information query attribute, fails with 5.

But i will check my code again, i think i miss something there,...

Regards

Kerem

Hi V.,

Re: Get Handle Owner,...

my fault the SID for the Accounts i dont get the Information is the Network-Account. I have full admin rights and all priviliges enabled, but i think, i make some mistake here. I will, i must investigate my code in more detail,...

Regards

Kerem

I still don't get it why you struggle with opening processes and stuff if QueryServiceConfig and the lpServiceStartName member of the QUERY_SERVICE_CONFIG struct gives you all the information you need. I use this function on a daily basis to get the user name of a service. And no, it is *not* the service name, it is the principal under which the service is running.
