Main development PC – notebook HP xe4400 – 2 GHz/1Gb RAM

Main OS – Windows 2000 Server / Domain Controller

Main RAD – Delphi 6 Enterprise

Main test environment – Virtual PC 2004

At first Virtual PC 2004 instance – Windows 2000 Server with Exchange Server 2000

At second Virtual PC 2004 instance – Windows NT 4 Server with Exchange Server 5.5

At third Virtual PC 2004 instance – Windows XP Professional with MS Office and other tools.

You can download trial version of OS and Servers from Microsoft site or order evaluation kit CD – the evaluation period is 12–180 days.

<http://www.microsoft.com/exchange/evaluation/trial/2003.msp>

Exchange Server 2003 trial software should not be deployed in a production environment. You can only deploy Exchange Server 2003 trial software in a test environment, but this is your need as I see.

Benefits of Virtual PC 2004? I not spend money for hardware. Virtual PC 2004 allows me to build private network in one PC, and simulate any software environments. Also main (host) PC is with clean installation and I can make any experiments over OS and ES inside Virtual PC – Virtual PC allow me to create UNDO DISK and if something is crashed to restore previous OS settings.
