IMHO

microsoft.public.win32.programmer.kernel be better NG for your question

Arkady

Hi,

I've configured the Windows Event To Translator to send traps for system events.

We receive a trap with the enterprise id set to the ascii code of the category however, the 2nd varbind of the trap reports "Unknown" where I assume the category listed .

The 1st varbind is the correct message text and the third is the correct source.

The trap id looks like this:

1.3.6.1.4.1.1.311.1.13.1.9.68.70.83.101.114.118.105.99.101

Where 311 is for microsoft, 9 is the length and 68.70.83.101.114.118.105.99.101 is the ascii equivalent of "DFService", which is our category, but again the varbind says "Unknown".

How do I get the category set correctly in the varbind?

Thanks in advance,

Rob Adelberg
