Hi,

I would like to write an IOCP server which is act as middle man to receive the data from client A and pass it to client B

First, when client A and client B connect to the server, i will store both client socket handles.

First we call `WSARecv()` with the socket handle from Client A. Server will able to receive the data from client A.

But after i call `WSASend()` by using socket handle from Client B in order to send data from A to B, i able to do it, but after that `GetQueuedCompletionStatus` will waiting there for data from Client B.

My question is in order to receive the data from A again, should i call again `WSARecv()` after `WSASend()`?

.
