Hello,

Sorry for a long delay with answer. Actually a call to register a groupname is making a broadcast with at least 4 udp messages on my machine (XP SP2). Probably it also wait for a reply within a specified interval of time, that's why there is delay when executing a function. Here is what I see in my sniffer when I do a registration (the machine which is registering a groupname is not the same where I sniff the data)

```
0000 80 20 29 10 00 01 00 00 00 00 01 20 47 42 47 . )..... GBG
0010 42 41 41 41 41 41 41 41 41 41 41 50 50 50 BAAAAAAAAAAAAAPP
0020 50 50 50 50 50 41 41 41 41 50 50 41 41 00 00 20 PPPPPAAAAPPAA..
0030 00 01 c0 0c 00 20 00 01 00 04 93 e0 00 06 80 00 .....
0040 c0 a8 00 7e ...~
```

Where 0000 29 10 is the "registration", and the description of packet,
aa<00><00><00><00><00><ff><ff><ff><ff><00><00><ff><00>: type NB, class
IN

Yes, you can use russian language, but the NG is english speaking.

If I have correctly understood you, at initialization of a group name I do not transfer what data. The delay seems to me is connected to adjustments NetBios but with what I do not know. On the majority of computers with Windows XP there is a delay at initialization of a group name, but on my computer of it is not present. In my application sometimes it is necessary to carry out initialization up to 15 group names, therefore such delay causes long start of the application.

It is possible to communicate with you in Russian language?
