I am new in this field of TAPI. i am using modem for making calls. can any one help me in developing my application in C# 2.0

i have <http://www.codeproject.com/KB/IP/devangpro.aspx>, this code. now problem is that one side can hear the voice but other cant't. as i have selected both terminals for audio settings. then why one can't hear voice.

secondly i am confusing that later we will use avaya hardware with tapi application for call center application. will avaya give us the tapi sdk or we have to develop according to avaya hardware.

thirdly, if any one have complete example of tapi 3.0 or sdk which will help me a lot whether i am going on right track or not...

also tell me that can tapi handle simultaneous calls. if yes then how that we have to handle in C# code...

Regards..

.
