We have a number servers that have about 80 printers configured each. The servers are accessed by the users through terminal services. We are going to add another server in the server pool and we would like to find an easy way of installing the printers without going through the add printer wizard. All these printers are accessed via network so TCPI/IP ports have to be created as well. Is there a way through an application to export the printer configuraiton from one server and import it into another? Can anybody give me an example?
