Hi Doc,

Thanks for your details information.

Yes, your further information makes me understand the context much better now.

I think the threading may still be a problem here. I assume your framework HWND window is placed as a child window of the main application. So the system user32.dll may still generate message to the HWND window, which may cause some problem since the HWND window is created in another thread.

Anyway, I will try to contact some other UI experts to get some more comment. Thanks.

Best regards,
Jeffrey Tan

Note: The MSDN Managed Newsgroup support offering is for non-urgent issues where an initial response from the community or a Microsoft Support Engineer within 1 business day is acceptable. Please note that each follow up response may take approximately 2 business days as the support professional working with you may need further investigation to reach the most efficient resolution. The offering is not appropriate for situations that require urgent, real-time or phone-based interactions or complex project analysis and dump analysis issues. Issues of this nature are best handled working with a dedicated Microsoft Support Engineer by contacting Microsoft Customer Support Services (CSS) at
<http://msdn.microsoft.com/subscriptions/support/default.aspx>.
