Hello everyone,

I want to get my feet wet with WMI programming and I had the idea of writing a WMI provider that would retrieve information about interactive logon sessions from an NT machine – so you could query if someone is currently interactively logged in to a particular computer and who this/these person(s) is/are. Is there already some standard functionality for this purpose or would such a provider actually fill a gap? I simply don't want to reinvent the wheel if there is already such functionality built into WMI as it ships with the OS or if there is already some third-party functionality available for this. As for logon session retrieval I already have working code for that for NT/W2K/XP.

TIA,

--

Stefan
