Peter I don't really understand...I had thought that it would run as a hidden process, like I tested it with notepad.exe and that runs as a process in taskmgr but it doesn't open up or anything so the user will have no idea that its running, I wanted the same with my program. What my program does is that it writes to a file a list of software installed on the PC, so I thought that if I copied the file to the remote PC and then used the `objWMIService.Create("c:\scripts\MyProgram.vbs", null, null,intProcessID)` command then it would kick it of and create the output file with the results. There are no prompts or no UI that the remote user would see so there wouldn't be any user interaction??
