James,

Since writing this i've made some progress i.e. NetConnectionID property in the Win32_NetworkAdapter class contains the device description which reflexs the NIC description in the network connections in control panel. However I can't seem to find the property nor class for the binding order of the nic cards. Can you help?

regards

Hi All

Could anybody help is me in writing a PowerScript (or MSH)/WQL snipet which could query a Active Directory or Organizational Unit for a list of hosts, then query this list and return all active NIC cards which have Green or Yellow in there description (as per there property which can be configured in the control panel network properties in the win OS). This list could then be acted upon to change there settings i.e staticIP / subnet DNS etc?

Which particular part of the script are you having difficulty with?

Best Regards,
