One last thing, both systems were running Windows XP SP2

"Tango" wrote:

Hi,

We have been doing some testings with the Win32\_NetworkConnection class and we found some curious behaviour.

We ensured that the mapped drives were connected and tested with wbemtest and the results were OK, then we tried to do the query from a remote machine using the same credentials as the logged user in the target system. In the exact moment that the query is made, the mapped drive is marked as disconnected and we never get the connected result even if the mapped drive is fully operational.

Why is this behaviour happening? Is there a workaround to get the proper connection status?
