Has IIS ever worked correctly for you? If not, I suspect a flawed install, and suggest that you uninstall, then reinstall IIS. Afrer you do that, you'l

Re: can't build asp.net project after building once (trouble with ISS)

need to remap Visual Studio and .NET to IIS by either:

- 1) Uninstalling and reinstalling the .NET Framework, or
- 2) Following the instructions in Microsoft Knowledge Base Article #306005, pertinent part below:

"

After you install the Microsoft .NET Framework SoftwareDevelopment Kit (SDK) or Visual Studio .NET, Microsoft Internet Information Service (IIS) mappings are created to associate the new file extensions and settings for ASP.NET. If you did not have IIS installed when you ran the SDK or Visual Studio Setup, or if you uninstalled and reinstalled IIS after you ran the SDK or Visual Studio Setup, those settings will not be in place. You experience unexpected behavior when you try to view ASP.NET pages.

When you try to create a new ASP.NET Web application in Visual Studio .NET 2003, you receive the following error message:

Visual Studio .NET has detected that the specified Web server is not running ASP.NET version 1.1. You will be unable to run ASP.NET Web applications or services.

MORE INFORMATION

To fix IIS mappings for ASP.NET, follow these steps:

Run the Aspnet_regiis.exe utility:

Click Start, and then click Run.

In the Open text box, type cmd, and then press ENTER. At the command prompt, type the following, and then press ENTER:

```
"%windir%\Microsoft.NET\Framework\version\aspnet_regiis.exe" -i
```

In this path, version represents the version number of the .NET Framework that you installed on your server. You must replace this placeholder with the actual version number when you type the command.

Register the Aspnet_isapi.dll:

Click Start, and then click Run.

In the Open text box, type the following, and then press ENTER:

```
regsvr32 %windir%\Microsoft.NET\Framework\version\aspnet_isapi.dll
```

Regsvr32 returns the results of the registration."
