Hi All,

Based on the sample kbbbar.net applicaation i have created a tool bar for windows explorer. Now i have to enable and disable few buttons based the user slects file in the explorer. For to sync this i have set-up the connection point as in the following function. I could able to get the events only when the user double cliks a folder in the explorer preview or list view. If the user slect an item by single click no notification is recieved from Explorer. Please help me in this regard.

```
private void ManageConnection(ConnectType eConnectType)
{
    if (Explorer == null)
        return;

    // Explorer is nothing but an instance of WebBrowserClass
    UCOMIConnectionPointContainer cpc = Explorer as
    UCOMIConnectionPointContainer ;
    if(cpc != null)
    {
        UCOMIConnectionPoint spConnectionPoint;
        Guid guid = typeof(SHDocVw.DWebBrowserEvents2).GUID;
        cpc.FindConnectionPoint(ref guid, out spConnectionPoint);
        if (spConnectionPoint == null)
            throw new ArgumentException("COM object does not
            support specified source interface");

        if (eConnectType == ConnectType.Advise)
        {
            spConnectionPoint.Advise(this, out iCookie);
        }
        else
        {
            spConnectionPoint.Unadvise(iCookie);
        }
    }
}
```

Getting selected files from windows explorer

```
else
{
throw new ArgumentException("COM object does not support
events");
}

}
```

Alos I have few questions.

1. The connection point works both in the IE and Windows Explorer.
How
can i restrict to only Windows explorer.
2. Whether webbrowser class is equivalent to Windows explorer? or
there is any other class for windows explorer.

Thanks for your patientce and help.

Tx,
Shafeeque O.K.
