Hi All

I have written a website in DotNet (C#) which uses Role-based Security with Forms Authentication

When a user logs in, their roles are retrieved from a SQL Server database and an authentication ticket is created.

My only problem is that a User should only have to login every few months but I want any changes made to a users permissions record in the database to be picked up every time the user logs in.

In other words, if a user has been granted an "Admin" role and then has this role revoked because they have misused it, I want the user to be prevented from accessing the "Administration" area next time he or she accesses the website.

I'm guessing that I Would need to update the FormsAuthenticationTicket, possibly within the Session\_Start section of Global.asax.cs

If anyone could please give me some advice or a URL of an article which covers this then I would be very grateful.

Many thanks in advance

John
