I wrote a ado.net application that uses dataadapter,connection and command objects.

I have a procedure to populate dataset.I call dispose on all objects after dataset is populate and close the connection.

I see that the application still uses connection on sqlserver(I verified this by executing sp\_who on sqlserver) application dosen't release connection untill I close the form or end the application.

I tried calling gc.collect but this did not work.

What is work around for this problem ?

Please suggest
