A couple of days ago I posted a question on updating a database from a winform using a datatype of text. Thanks to Frans Bouma and Cor for answering.

I think I have a better understanding now but would like to clarify one thing. I am doing my updates by taking advantage of the automatic update, inserts and deletes options when configuring the data adapter for the winform (in design mode). It seems to work ok but I need to clarify whether there is concurrency checking when doing an update on a data type of text. It appears that there is not. Is this correct?
