Just applied SP1 for v1.1 of the .NET Framework, and we're receiving the following error message when closing a SqlConnection, that has been manually enlisted in a distributed transaction:

An event was unable to invoke any of the subscribers

Server stack trace:

```
System.Runtime.InteropServices.COMException
  at System.Runtime.InteropServices.UCOMIConnectionPoint.Advise(Object
  pUnkSink, Int32& pdwCookie)
  at System.Data.SqlClient.ConnectionPool.PutConnectionManualEnlisted(SqlInternalConnection
  con)
  at System.Data.SqlClient.ConnectionPool.PutDeactivatedConnection(SqlInternalConnection
  con)
  at System.Data.SqlClient.SqlConnection.Close()
  at System.Data.SqlClient.SqlConnection.Dispose(Boolean disposing)
```

The server is a Windows 2000 Server, with SP3 applied. Has anyone else ran into this? I noticed one other post about this on 08/19/2004:

[http://groups.google.com/groups?hl=en&lr=&ie=UTF-8&threadm=A4680398-C571-4D17-AEFA-1944752605B0%](http://groups.google.com/groups?hl=en&lr=&ie=UTF-8&threadm=A4680398-C571-4D17-AEFA-1944752605B0%00)

But the user was running on Windows 2003 or XP, and was utilizing the ServiceDomain class. We're not doing utilize either of these.

Any help would be greatly appreciated.
