Welcome to "Concurrency Management"

The below situation can be rectified by doing two things

- a) Updating only the columns that you changed.
- b) Checking the value of each column before doing the update. i.e. If A's value used to be 1, then at update check and see if the value is still 1 and update it to the new value (say 2) only if this test passes.

You can do the above by looking at various versions of values in your dataset.
