

How do you create a Datatable with a non-unique index on a column?

Hi

I have a strongly typed datatable which has a column that I perform a search. To speed it up I would like to add an index to it, however this column contains duplicate values. Is there anyway I can add it? I can only find primary and unique keys in the dataset designer.

You must be able to because when you add a datarelation it must create an index on the child table.

Thanks
Kevin
