I hear them back, but they didn't find a solution or a workarround until that moment. I am interacting with Microsoft via a support case, on the support site.

I will copy your message to them.

Did you ever hear back from MS?

Do you have a link to the bug? Is it on labs.* or somewhere where I can follow its progress?

This is making me and MS look very bad with the client since this problem existed in a CTP (every request) then went away in the Sept bits and then came back (ocassionally—even worse) for RTM. In our case, we anecdotally believe that network issues (address conflict, connection lost, timeout?, etc.) lead to the problem.

Hi Jeff,

We have posted a simple code reproducing the behavior to Microsoft. They confirmed to be a issue in ASP.NET 2.0 and asked to wait for a couple of weeks until they find a way to fix it.

Meanwhile, you can try to avoid this exception by guaranteeing that your application doesn't raise any exception during a distributed transaction. Once this happens, the "New request" exceptions pops up through all your application until you restart the IIS.

Regards,

We haven't seen this since an IP address conflict was found on the network so that may be the problem. I'll repost if it shows itself again. If this is caused by an IP address conflict it is still a MS bug that the transaction or connection was left in this state requiring an IIS restart to fix the problem.

Jeff
