ok.. I worked on this the problem is that I gave the provider detail also in my connection string.

```
<connectionStrings>
<add name="DevDBConnection"
connectionString="Server=MyServer;database=MyDB;uid=MyUser;pwd=MyPwd;"
providerName="System.Data.SqlClient" />
</connectionStrings>
the culprit is providerName="System.Data.SqlClient"
```

I tried the same User Id and pwd in a UDL file, Visual studio 2005 etc everthing worked. so I started playing around the conn.string. When I tried without the Provide Name attribute it worked :).

Thanks for your support and reply.
