

Reserved Words

I am attempting to update/insert to a Microsoft Access Database. I have a database column that is unfortunately using a the reserved word 'output'. Changing this name isn't a very viable option (at least not now). My problem is that I cannot get the database to update using .net because it gives me the following error: "The field 'tblTimesheetEntries.Output' cannot contain a Null value because the Required property for this field is set to True. Enter a value in this field." It's all bound correctly on the page and I'm pretty sure it is a problem with using the reserved word 'output'. The column name output is bracketed ([output]) in the update and insert statements. If anyone knows of a workaround for this it would be greatly appreciated.

Jimmy
