Hello manoj241176@xxxxxxxxxx,

There are a lot of different things that affect the performance. Its difficult to determine exactly from this set of minimal description. Have you tested the performance locally?

Thanks,

Hi,
I have concern regarding two approaches to decide,
1>DataSet.WriteXML
2>SQL Server 2000 to return XML from stored procedure.
With Second approach, I have to open Cursor's and nested stored proc calls and have to create temporary tables. while in first approach I dont have to create all this.

So please suggest me, out of these two approaches which will be faster and will affect performance??

Thanks,
Manoj
