Adrian,

Try something as this from an old program of me,

```
cmd.CommandText = _
"CREATE PROCEDURE InsertMessage " & vbCrLf & _
"@Answer ntext, " & _
"@Problem nvarchar " & vbCrLf & _
"AS" & vbCrLf & _
"INSERT INTO tblMessages (Problem, Answer) VALUES (@Problem, @Answer)"
cmd.ExecuteNonQuery()
```

I hope this helps,

Cor

I have a text on Stored Procedures.

My questions were the following

- (1.) The code below does not have "CREATE PROCEDURE" in it, as my text on SP tells me Stored Procedures should have.
Question: "Is the code below a Stored Procedure after all?" Yes / No.

The code:

```
USE master
GO
CREATE DATABASE Products
ON
( NAME = prods_dat,
FILENAME = 'c:\program files\microsoft sql server\mssql\data\prods.mdf',
SIZE = 4,
```

Re: Creating a database

```
MAXSIZE = 10,  
FILEGROWTH = 1 )  
GO
```

Answer "No"

(2.) The code has been taken from MSDN and is Transact SQL. If it isn't a SP

then I should be able to stick the code into a CommandText string and do an

ExecuteNocQuery. However if I want to create a database, that database is not going to be there in the first place, so what do I put in the connect string, since the connect string has to specify a database name?

Answer "Yes"

Question A.

Stored Procedures seem to need "CREATE STORED PROCEDURE".

Question: how do I get the code to comply to the stored procedure syntax?

Question B.

I can create a stored procedure from within the Server Explorer and from SQL

Server Manager Studio Express. From within VS I have to follow this route according to a text I have: File -> New Project -> C# -> Database -> SQL Server Project. I do not have these options in my VS Standard Edition. Is it

still possible to create a SP in my VS Standard Edition without these options (not using the two methods I have already stated, viz: from within the Server Explorer and from SQL Server Manager Stu
