Otis,

It was just in the style of your question.

I do not want to use

Did my reply sound rude, than I succeeded in what I wanted to show you.

Cor

VineetBatta,

If you want to use the arraylist instead from a normal performing solution without troubles, than why are you asking for help to us.

Do you think that I want my name with a non good solution on internet?

It sounds for me the same as I want to increase a number but I want to use the divide operator.

Cor

I have Custom Data class which stores data about single customer and then i store that customer objects in arraylist as shown below.

```
Customer custdata = null; // Custom Data class for 1 customer data.
```

```
ArrayList ar = new ArrayList(); // To store more than one customer object.
```

```
for (int x = 0; x < 30; x++)  
{  
    custdata = new Customer();  
    custdata.CustomerID = 1234 + x;  
    custdata.CustomerName = "Name" + x.ToString();  
    custdata.CustomerLocation = "UK " + x.ToString();  
    custdata.CustomerType = x.ToString();
```

```
    ar.Add(custdata);
```

```
}
```

```
grid.; /// FEW Steps are missing and not sure to make it compatible to Grid.  
grid.DataBind();
```

Now i want to bind data to gridView control, just like as we do if it was Datatable.

Is there any simple conversion possible?

I do not want to use DataSet or DataTable but collection of Customer Objects in Arraylist.

Re: bind data to gridview using custom data class?

Thanks in advance.

–Vineet

Cor,

Perhaps you should also read the book mentioned in my answer to Vineet's post.

Your post, besides being aggressive and rude, sounds as though you missed that

particular part of learning about data binding.

Good luck with your project,

Otis Mukinfus

The original post was not mine, so you originally did not answer my question. However it's interesting that you admit your intention was to be rude. Not very good behavior for a MVP my friend.
Good luck with your project,

Otis Mukinfus
