You have any good references to point to beyond what's on MSDN? I've been trying to fire notifications based upon events occurring in the database and so far, the only result I've had is to lock up the database. I've posted a couple of questions in the forums without any response, so I figured that SqlNotifications was just vaporware. Except for this post, I've not heard of anyone (outside of Microsoft) who actually got the scheme working. The hazard I run into is that most developers seem to be working for large companies where they have unlimited amounts of time to get jerked around by features and functions that do not work "as advertised", so ultimately they do get it resolved. Unfortunately, my clients do not fund time for me to explore every nook and cranny of some obscure object or feature that doesn't work the way Microsoft describes it. Even something as trivial as a bug in a Microsoft control can disrupt my day, so you can imagine where SqlNotifications falls in that continuum.

I have an application that runs on a server which is updating stock prices every 15 minutes from external data sources.

I have an other application that runs on users' PC. This application is using a SQLDependency object to automatically refresh one of the screen when changes occurs in the database. It was a bit tough to setup but it is now working great.

Re: SqlNotificationInfo

Someone who actually got SqlNotifications to work? I thought that capability was just an urban legend...

"Lubomir" <Lubomir@xxxxxxxxxxxxxxxxxxxxxxxxxxxx> wrote in message news:96C69538-8851-4B2D-BE35-C972828DBF35@xxxxxxxxxxxxxxxxxxxx

Hi,

To capture changes in the database I am using SQLDependency. When the change is notified I update my UI.

In the handler for OnChangeEvent I checked what type of info is passed to the method argument. I find out it is "Error"

In MSDN I read it is an Internal Server Error.

However, when I ignore this error, my app works just fine (at least it seems to). What does mean that error?

Thanks,

Lubomir
