Dear Manjree,

Did you receive any error message when you executed SP from ado.net?
For such issue, I would like to suggest you use SQL profile to trace server.

- 1) Open SQL 2005 Server Management Studio.
 - 2) Connect your Database Server and click "connect" button.
 - 3) Click Tools|SQL Server Profile in the menu.
- * Note: SQL server 2005 express edition doesn't have SQL Server Profile. If you are developing with this edition, please let me know.
- 4) Connect your Database server and click "connect" button again in the SQL Server Profile.
 - 5) Create a new trace and select "Run" button with default configuration.
 - 6) Reproduce the issue.
 - 7) After repro the issue, please stop the select trace in SQL Server Profile.
 - 8) Save the trace file as SQL Server Profile trace file (*.trc)
(File|Saveas|TraceFile)

Please packet the trace file and send it to me (v-wywang@xxxxxxxxxxxxxx).
By the way, please let me know the exact database name and stored procedure name. I will review on it.

Sincerely,
Wen Yuan
