William,

Thanks for your response. You obviously see what we're trying to do and are up against.

This application runs a bunch of batch procedures to group data in our data mart into smaller tables.

We created an account specific for this application with full rights (as far as I know) but the DTS package gets the same security error with the release .exe.

Should there be a way we can get this to work without someone with admin rights granting client access security to the .exe on the sql server? I was also wondering if I have to digitally sign the .exe or something.

Thanks again,

–Beth

I would have a conversation about rights and privileges with your DBA. My new book discusses the basic elements of Windows Forms and ASP.NET security so you might take a look at Chapter 9. Basically, you either need to have the DBA create a SQL login for the application or for the class of users that will use the application and grant rights to that login for the specific resources the application uses—and no more. This means the application should only have rights to the specific stored procedures and views you've used—but not to the base tables.

Yes, I'm connecting with Integrated Security=SSPI.
Is there another way I could connect to avoid these problems?
Like have a new account created for this application?

When you say I need to grant rights to the group to which I belong, are
you
talking about on the SQL Server?

Since I'm not the DBA, can you tell me what I should tell him to ask for?

Thanks for the help,

-Beth

"William Vaughn" wrote:

How are you connecting? SSPI (trusted connection?)
If so, you're probably right. Because you're not in the
Administrators
group
you don't have sufficient rights. In this case you need to grant
rights
to
the group to which you belong that are sufficient to make the
changes.

Hello.

I'm an old VB6 programmer who would like to distribute an .exe with the simplest method possible, and that's not working.

I have an application which updates rows on a SQL Server. If I run the .exe in my project's debug folder, it runs fine. If I run it from my project's release folder, I get a sqlClientPermission error when it tries to update data on the server.

I don't have administrative rights to my PC, so I'm assuming I have to live with this or find someone with admin rights to grant me permission to run the release version of my application on my PC.

If I run it copied to a folder on the network, I get the same error, but what I really need is for it to run in a DTS package on our SQL Server so it can be scheduled to run nightly.

The release .exe gets the same error in the DTS package, and I'm not sure

Re: xcopy deployment to sql server DTS package in restricted envir

who needs to do what to get this to work.
The debug.exe runs ok in the
DTS
package as long as my sps have dbo
ownership.

I'm not sure if I need to create a setup project
and have the DBA
install
the .exe on the sql server, have some
administrator (not our DBA) grant
client access permissions to my .exe on the
sql server, or some other
set
of
magic tricks.

Distributing applications used to be easy, but
now it's harder and
muddling
through documentation on code access
security is frying my brain.

Please help me if you can.

Thanks for all replies,

-Beth
