

Connect without async but get timeout error when async=true

Have an app deployed on a network. On some machines, a regular connection to the sql server establishes and works great, but the same exact connection string along with "Asynchronous Processing=true" gives a "Timeout expired. The timeout period elapsed prior to completion of the operation or the server is not responding." error. I know the timeout setting isn't the actual issue, and the client machine can demonstrate connectivity to the sql server manually (and like I mentioned, has no problem connecting without the async). Is anyone familiar with anything like this?
