One is a local access database (i.e. on the same box as the .net code being run on), the other is a remote sql server which I can access via ip address. Am I doomed?

No :).

You can link the remote sqlserver database inside access if I'm not mistaken, as a set of tables.

Which data is merged into which one btw? Access into sqlserver?

FB

Thanks

Regards

Hi

I have an insert sql that inserts selected records from one table into another. Is there a way to specify in the insert statement that one table is from one database and the second table is from another database i.e. insert is between tables of two separate databases?

depends on the database system used. If you use sqlserver, and you have both catalogs in the same server, you can do:

```
INSERT INTO [cataloga].[schemaowner].[table] (field1, field2,...)
SELECT field1, field2, ...
FROM [catalogb].[schemaowner].[table]
where...
```

Re: Insert between separate databases

schemaowner is usuably 'dbo'

If they're on separate boxes, you can link one server into another server. You then get yet another name in front of the table name:

```
..  
FROM [server].[catalogb].[schemaowner].[table]...
```
