Hi,

I'm trying to make a page that has a dynamic menu on the left. I generate this menu by getting the menu items from a database table that holds title, alt tag, link, sort order, etc... for a given menu ID. I had done a static version up until now and the number of pages have gotten huge and this is why I decided to put menu info in the DB. Right now I have a menus in a HTML Table with the following property in every <TD> tag of every <TR> tag of the menu table:

```
<td height="20" class="gt0" nowrap onmouseenter="this.className='gt1'"
onmouseleave="this.className='gt0'">&nbsp;  <font face="Arial,
Helvetica, sans-serif"><a
href="www.google.com">professional</a></font></td>
```

How can I do this in C#? I get the table entries and have something along the lines of:

```
Table table = new Table();
while(datareader.Read()) {
    TableRow row = new TableRow();
    TableCell cell = new TableCell();
    cell...//set all properties
    Hyperlink link = new Hyperlink();
    link...//set all attributes of the link with data from DB
    cell.add(link);
    row.add(cell);
    table.add(row);
}
```

How do I specify the event listed in the <TD> tag that is listed above in the TableCell? i've fooled around a bit, but not having good books and unable to find examples have left me to a last resort of posting the problem...Any help would be really appreciated.

Thank you :)
