The choices are limitless here – anywhere from a multiline text box to an embedded word document. It just depends on how much functionality and flash you want to pack in.

Hi– I'm new to C#.NET ver 2; I have a TreeView control and whenever one of the nodes of the TreeView is clicked, it should bring up a formatted text output to its right (the fields on the text triggered by database table values). Can someone advise me as to what controls to use for text

output?

Thankyou!!
