Hi,

I'm new to the new asp.net :-). I've set up a web form with a grid and an objectdatasource (in my presentation layer). I have a separate datalayer project which has webservices in it. I tell the objectdatasource what my update method is by referring to a web service method through a web reference in the presentation layer (The webmethod IS my update method).

This almost works. What I've found is that the web service parameters are all of the fields in the grid (including the pk) and an original version of the pk is tacked on to the end of the paramaters. Before I did this I was getting errors telling me that it couldn't find a non-generic ..I'm sure you've all seen the error.

Once I got rid of that error by giving the web method the signature the objectdatasource wanted, I still couldn't update data. I tried just running the web service by itself which worked. However when I ran the code (gridview and all) and checked the parameters coming into the webservice, I found that the original version of the pk was zero. I changed it in the debugger to the be same value of the pk parameter being passed and I was able to save my changes.

I'm not sure what is wrong here. Is there a setting somewhere that will pass the correct value of the original pk from the objectdatasource to my web method?

Thanks,
Fig

.
