I have created a very simple web service and consumer test application. It works like a charm on my development pc, but when I try to deploy it to an intranet setting with an xp client and a windows 2003 server with IIS running, the consumer application gets a 405 error when it tries to access a web method.

I'm not sure whether this is security, deployment, or some miscellaneous configuration that is the problem. For deployment, I created a virtual folder in IIS and took all the defaults. I then copied the asmx file to the virtual folder and added a bin folder with my web service project's compiled dll. Is there more that I need to do? Something I read implied that that was all there is to it, but maybe I'm missing something.

Also, I opened IE on the client (xp) machine and navigated to the asmx on the server, but that gives me a "page cannot be found" message.

Any suggestions would be welcome, even if they're just general links to info on web service deployment.
