Hi,

I don't really know where my question should be posted, so if i am in the wrong section i'm sorry.

Okay now to my question. I am using ASP.NET to consume a web service. Then I get an xml base response from the web service. My question is what is the right of going about to parse through the data and then display the data? I was thinking of using XSLT.

So XSLT will help me parse the data, I also want to use that data i parse with code.

For example, I call a web service to get booking avaiability from an Airline Agency. They respond back with an XML document. I want to get specific data from that XML document display it for the customer in a neatly formatted way. Then the customer will pick a flight they are interested in and then my code will generate a response back to the Airline Agency.

So I need to know how I should do this. Kind of confused in how I should go about to do this.

Thank you,
Tesh
