I just reloaded my pc with XP Pro from W2000. I had to reload all my software as well. Here is the one last problem. One web service I use does IBM MQ activity. In the past, the web service had no permission issues with this. Now, I get a 2035 user authorization. The MQ Cluster is on a remote machine. On this remote machine, I can see in the event viewer the message that 'aspnet' entity lacks the authority to connect. Thus, apparently, my web service is running under the aspnet iD. Under my old configuration, it must not have been, b/c nothing has been changed on the remote server. If aspnet doesn't have permission now to connect to MQ object, it didn't previously. So, I believe that I used to run the web service under an ID authorized to do this MQ work. I also have XP Pro on my home PC and have no problems using the same web service. I have went into IIS and make the settings on my work PC identical to those on my home PC, but each time I run from work PC– it goes with 'aspnet' id and fails MQ authorization. The settings I have in IIS under default web site – properties – Directory Security – (first edit button) – Anonymous access is checked and User name is IUSR_HOME-SCHOOL1 and Allow IIS to control password. I also have integrated windows authentication checked.

Under my virtual directory properties in IIS, under Directory Security – (first edit) I also have integrated windows authentication checked. I have made various attempts with different combinations here and previous page.

On my home PC (where this works correctly), ASPNET is a member of USERS & IUSR_HOME-SCHOOL1 is a members of GUEST group. I have set up these the same on my work PC. All to no avail. I am frustrated, because under my old W2K setup at work (where I sign in as a domain user in Administrator group on my computer) and at home (where I sign is a local user in Administrator group), I was/am able to run the webservice under some – non-ASPNET id – although I don't know what it is, but it has proper authority. I need that set up the same on my work PC now.

Please help.

THanks,
Tim
