Hi,

you could use Session variables when values are kept in memory for user's session (at server). Another way could be using cookies (they are readable if user really wants that but work for 'quick' hiding) or just using Server.Transfer, when processing of request is transferred to another page at the server without client browser intervention. Server.Transfer works like Response.Redirect but the exact difference is that redirect happens without client browser knowing that (with Response.Redirect browser is making the actual redirect request).
