Actually the thing is:

I code on production environment.

I mean the server where I code is being used. (People use

<http://server/WebApp1> )

On the same server I am working on another project. (Lets say

<http://server/WebApp2>)

These 2 projects are .NET projects and they reside on the same IIS.

What I want is to be able to debug WebApp2, without preventing people access to WebApp1.

At the moment, when I am in debug mode on WebApp1, people cannot access

<http://server/WebApp2>.

When I stop debugging, everthin is fine.
