Here is an example of how I do this – it combines code in the code-behind and javascript. The </form> and </body> tags are there to show where to use this:

```
</form>

<%if disableMe then%>

<script language="javascript">

    var disabled = true;

document.all.btnDisable.disabled = true;

</script>

<%else%>

<script language="javascript">

    var disabled = false;

document.all.btnDisable.disabled = false;

</script>

<%end if%>

<script language="javascript">

    function shouldsubmit()

    {

        if (disabled==true)
```

microsoft.public.dotnet.framework.aspnet: Re: How to disable the users to submit a page for a second time?

```
        {  
            return false;  
        }  
    else  
    {  
        disabled = true;  
        return true;  
    }  
}  
  
</script>  
  
</body>
```

```
Private Sub Page_Load(ByVal sender As System.Object, ByVal e As  
System.EventArgs) Handles MyBase.Load
```

```
    If Not Session("disableMe") Is Nothing Then
```

```
        disableMe = Session("disableMe")
```

```
    End If
```

```
End Sub
```

```
Protected disableMe As Boolean = False
```

```
Private Sub btnDisable_Click(ByVal sender As Object, ByVal e As  
System.EventArgs) Handles btnDisable.Click
```

```
    disableMe = True
```

```
    Session("disableMe") = disableMe
```

```
End Sub
```

> *Hi all,*

> *I have a login form that uses custom validators and I'm trying to stop the
users to submit this form twice. When I disable the button I don't know why,
but the request is cancelled. It seems that the page gets invalid and it
never gets the server, but why?.*

Re: How to disable the users to submit a page for a second time?

microsoft.public.dotnet.framework.aspnet: Re: How to disable the users to submit a page for a second time?

> *I've tried using a hidden control which is increased by one every time the user presses the button; the login process runs only when the control has the value of 1. So when the user presses the button twice, the first request is made ok, but the user is not redirected from the login page because the second request is processed (the login process is not run because the control has the value of 2).*

> *Any help would be really appreciated.*

> *God Bless.*
