Hi there,

I have been learning c# for a while now, although mainly the language and I am little confused about the completed picture.

I am creating a website, part of it is standard html files, some are aspx files without any code behind files but inline coding and others are proper aspx files with code behind.

I am of course creating standard html files using dreamweaver as this is my preference.

Can anyone explain what the standard way of creating a so called "web application" i.e. should I create several web application for each part of my website which consists of code or should the complete website also be wrapped within a web application.

i.e. The webapplication is VS would also consist of html..??

I hope I have explained it correctly, as you can see I am a little confused...

Any help or guidance would be really appreciated

Thanks

Ian
