You can certainly eliminate that as a possibility. .Net and COM are totally separate technologies and do not interoperate with each other, unless you deliberately make them do so in your app, using COM interop, which I see no evidence of.

It sounds more like a network error, although using the VS.Net debugger to peek at the exception details would help to pin it down better. Try using the IP address of the machine instead of the machine name. And if you can debug the exception, it would help too.
