Yes I'm already impersonating the user at necessary times. That's why I'm able to create the AD account. But then it uses WMI against the Exchange server to create the mailbox. (I believe I'm correct on that)

Shouldn't allowing the IIS boxes computer account to delegate get this to work?

Forms Authentication isn't going to impersonate your logged on user because Forms Authentication doesn't directly authenticate these users against active directory. You've created the code to check AD, and then told Forms Authentication if they are validated or not.

If you need to impersonate an actual user, take a look at the code found on this page. <http://support.microsoft.com/default.aspx?scid=kb;en-us;306158>
You should be able to easily do it, since you had their username/password at one point in the application. You will have to keep track of their password somehow, perhaps in a FormsAuthenticationTicket, since I doubt you are running this code right after they log in.

Hope this helps,
