Not sure if this newsgroup is the right forum for this post.

I have been experimenting with embedding .NET Windows Forms User Controls into a web page. I have been pleased with the results that I have obtained so far, but have some questions regarding this implementation.

1. Is there anyway to access the IE browser script objects from within my user control as is done in javascript or vbscript?
2. My User Control needs to be able to access my Web Service that is protected in IIS using Windows Authentication. I need to be able to pass the credentials that IE uses to logon to my web site and pass it to my Windows Forms control so that it can pass the credentials to the web service. So..., is there some way that my Windows Forms control can access the logon credentials that IE uses to logon to my web site? I tried using DefaultCredentials, but it defaults to the logged on user when called from a Windows Form control. Not what I want.
