Joerg

Yes, I added the code to explicitly enable the proxy, but still no Fiddler entries at all. Spike1.aspx is intended to take the data from the form and stuff it into a database, but of course I could substitute a do nothing page. I haven't done so because it appears that we're never getting to the page in the first place. I suppose it's possible that the page is the source of the error, but that implies:

- 1.) My breakpoint on the page load handler isn't working.
- 2.) Fidler isn't catching the request.

I suppose that it wouldn't hurt to try however. I'll let you know what happens. Let me know if you think of any other ideas on trouble shooting this. Also, if you have the time I'd appreciate it if you'd try out your code on your machine just as a sanity check.

Thanks again for the help.
