I want to implement the same functionality as the "IISAdmPwd" that comes with IIS. When a user logs in via Basic Auth, and their password has expired, I want to bounce them to a page in my app which lets them enter their ID, old password, new password, and then I'll change their password via ADSI. What I would like to know is, am I going to have to write a custom ISAPI filter for the redirect? Or is there a way built into asp.net for this?

Thanks,
John
