Hi.

I have a web app that uses Forms auth in root Web.config, users must login to access asp.net resources. Now, I want one of the sub directory can be accessed anonymously. I found that if I just put a web.config which sets <authentication mode="None" /> in that sub dir will cause a Configuration Error ( It is an error to use a section registered as allowDefinition='MachineToApplication' beyond application level. This error can be caused by a virtual directory not being configured as an application in IIS.), but I have no idea how to deal with it.

Anybody can help me out?

Thanks!
